DETAILED ACTION

Priority

1. Receipt is acknowledged of papers submitted under 35 U.S.C. 119(a)-(d), which papers have been placed of record in the file.

Election/Restrictions

2. Applicant's election with traverse of Group I, claims 1-10 in Paper No. 7 is acknowledged. The traversal is on the ground(s) that "the embodiments delineated by the examiner are not patentably distinct and therefore constitute a single invention concept since the claimed method cannot be practiced by another and materially different apparatus". This is not found persuasive because a proper restriction requires a showing that the claimed apparatus can be used to practice a materially different method. As pointed in the previous Office Action, the claimed apparatus may be used in flying insect entrapments. The Examiner is not required to also show that the method can be practiced by a materially different apparatus. See MPEP 806.05(e).

The requirement is still deemed proper and is therefore made FINAL. Claims 11-14 are withdrawn from consideration. An action on claim 1-10 follows.

Claim Rejections - 35 USC § 112

- 3. The following is a quotation of the second paragraph of 35 U.S.C. 112:
 - The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.
- 4. Claims 1, 5, 7 and 8 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Application/Control Number: 09/909,186 Page 3

Art Unit: 1743

Regarding claims 1, 7 and 8, the phrase "such as" renders the claim indefinite because it is unclear whether the limitations following the phrase are part of the claimed invention. See MPEP § 2173.05(d).

6. Regarding claim 5, the phrase "or the like" renders the claim(s) indefinite because the claim(s) include(s) elements not actually disclosed (those encompassed by "or the like"), thereby rendering the scope of the claim(s) unascertainable. See MPEP § 2173.05(d).

Claim Rejections - 35 USC § 102

7. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 8. Claim 1 is rejected under 35 U.S.C. 102(b) as being anticipated by US Patent 5,525,466 to Slovacek et al.

Slovacek et al teach a cylindrical sensor waveguide (120). The waveguide has a surface coating (122) containing a fluorophore reference material (124). An antibody (126) for antigen (128) to be detected is attached to the surface. See figure 4 and col. 8, lines 25-32. With regard to Applicants' claimed base member, the Examiner has construed the coating of Slovacek et al to be a base member. The antigens (128) attached to the base member are chemical substances used for detecting antibodies. The waveguide (120) serves as the carrier around which the base member is wrapped. When the base member is coated onto the waveguide the base member takes the long, slender shape of the waveguide.

Therefore, for the reasons set forth above, Applicant's claimed invention is deemed to be anticipated, within the meaning of 35 USC 102(b), in view of the teachings of Slovacek et al.

Art Unit: 1743

9. Claims 2, 4, and 6 are rejected under 35 U.S.C. 102(b) as being anticipated by US Patent 4,844,869 to Glass.

Glass teaches an apparatus for assaying fluid samples. The apparatus comprises an optical fiber (22) inside of a hollow, elongated enclosure (24). The enclosure (24) is a tube made of optically transparent material (col. 5, lines 14-15). This is equivalent to Applicants' transparent container. The enclosure (24) has an entrance face (28) and a terminal end (30). These are the sample inlet and outlet. The enclosure with the optical fiber is coupled to a fluorimeter (43). The entrance face is illuminated by means of a light source with radiation capable of exciting or inducing fluorescence (col. 5, lines 62-67). The induced fluorescence tunnels back to be read by the fluorimeter (col. 5, line 67 – col. 6, line 2). The fluorimeter is equivalent to Applicants' measuring device and identification section, as recited in claim 6, since the fluorimeter reads the fluorescent signals. A means for introducing fluid into the enclosure is present as well as a supply pump (54) controlling the rate of flow of the fluid (col. 6, line 49 – col. 7, line 3; col. 8, lines 25-32). With respect to claim 4, Glass teaches that a mounting means (26) removably mounts the enclosure.

It should be noted that Applicants' describe their device by reciting several "sections". The Examiner has interpreted these "sections" to mean the actual structural components of the device. Applicants' claims do not recite any "means plus function" language, thus, the function of the structural components has not been given patentable weight. Should Applicant desire to invoke 112, 6th paragraph, means plus function, Applicants are required to amend the claims to be consistent with the proper 112, 6th paragraph terminology. Applicants should incorporate "means to..." or "means for..." into the claims to describe the structural components by way of their function. See MPEP §2181.

Claim Rejections - 35 USC § 103

- 10. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 11. Claims 3 and 5 are rejected under 35 U.S.C. 103(a) as being unpatentable over Glass in view of US Patent 6,251,688 to Erb et al.

Glass fails to teach a scanning section for relatively moving the light measuring section and container section. Glass also fails to teach a moving section for moving the inlet/outlet to where external containers are mounted.

Erb et al teach an apparatus for measuring binding between a protein and nucleotide. The apparatus contains a fiber assembly (7) with a cylindrical tube (9), similarly to Glass. Holes (4) serve an inlet/outlet to allow sample to be brought into and out of the cylindrical tube (9). See col. 11, lines 17-30. An optical apparatus is connected to the cylindrical tube to direct light at or near the optical fiber and measures the fluorescence, absorbance, luminescence or polarization of the molecules. The optical apparatus is equivalent to Applicants' measuring device (col. 14, lines 32-50). A sensor cartridge enables a treated surface of the optical fiber to contact a test solution. The sensor cartridge is equivalent to Applicants' scanning section. Erb et al also teaches a means for positioning of the sensor cartridge in the optical apparatus to enable excitation and measuring of fluorescence, etc. The means for positioning is equivalent to Applicant's moving section. See col. 14, lines 51-65. Further, Erb et al teaches a means for acquiring data from the optical apparatus. The means for acquiring data is equivalent to Applicants' identification means. It would have been obvious to one of ordinary skill in the art

Application/Control Number: 09/909,186

Art Unit: 1743

to use a sensor cartridge/scanning section of Erb et al in the device of Glass to move the treated obtical fiber into view of the optical apparatus so that the fluorescence, absorbance or luminescence of the fiber can be seen and the presence/absence of the target analyte can be determined. Further, it would have been obvious to one of ordinary skill in the art to incorporate a moving section into the device of Glass to allow sequential testing of various samples. The moving section will allow the optical fiber to move along several samples and test each samples for the presence/absence of sample analyte.

Therefore, for the reasons set forth above, Applicants' claimed invention is deemed to be obvious, within the meaning of 35 USC 103, in view of the teachings of Glass and Erb et al.

12. Claims 7-10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Glass in view of Erb et al as applied to claims 2-6 above, and further in view of Slovacek et al and US Patent 4,031,399 to Klein et al.

With respect to claims 7, 8 and 9, neither Glass or Erb et al teach a base member with chemical structures rolled around a carrier.

Slovacek et al is described above. Slovacek et al further teaches that the cylindrical sensor waveguide (being a base member having antibodies attached wrapped around a cylindrical waveguide) is used in conjunction with an optical processor (300). It would have been obvious to use the optical waveguide in the optical apparatus of Erb et al since the apparatus of Erb et al would provides one apparatus capable of withdrawing and disposing of sample fluid, exciting the optical fiber with light, and providing a output with the measured fluorescence, etc. to denote the presence of a target analyte. In using the apparatus of Erb et al

Application/Control Number: 09/909,186

Art Unit: 1743

with the optical waveguide of Slovacek et al, one could determine the presence of target

analytes using one device, as opposed to separate devices for each step.

With respect to claim 9, Klein et al teaches the conventionality of using a light shield in

fluorometer apparatuses to prevent interference from other light sources that may obstruct

with the reading. Thus, in order to prevent obstruction of readings, it would have been obvious

to one of ordinary skill in the art to include a light shield with the fluorometer of Erb et al to

prevent incorrect readings due to the presence of interfering light.

Therefore, for the reasons set forth above, Applicants' claimed invention is deemed to be

obvious, within the meaning of 35 USC 103 in view of the teachings of Glass, Erb et al,

Slovacek et al and Klein et al.

Any inquiry concerning this communication or earlier communications from the

examiner should be directed to LaToya I. Cross whose telephone number is 703-305-7360.

The examiner can normally be reached on Monday-Friday 8:30 a.m. - 5:00 p.m..

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Jill A. Warden can be reached on 703-308-4037. The fax phone numbers for the

organization where this application or proceeding is assigned are 703-872-9310 for regular

communications and 703-872-9311 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or

proceeding should be directed to the receptionist whose telephone number is 703-308-0661.
